BEING THE ANNUAL REPORT  
OF THE ROYAL NAVAL  
BIRD WATCHING SOCIETY

PUBLISHED 1977

## ROYAL NAVAL BIRD WATCHING SOCIETY

### *Affiliated to:*

The International Council for Bird Preservation, British Section.  
The British Trust for Ornithology.

### *Patron:*

His Royal Highness The Duke of Edinburgh, K.G.

### *President:*

Admiral Sir N. S. Henderson, G.B.E., K.C.B.

### *Vice-Presidents:*

The Master, The Honourable Company of Master Mariners

Commandant Vonla McBride, Director W.R.N.S.

Miss Patricia Gould, Matron-in-Chief, Q.A.R.R.N.S.

Commander Sir Peter Scott, K.B.E., D.S.C.

### EXECUTIVE COMMITTEE

#### *Chairman and Editor:*

Captain G. S. Tuck, D.S.O., R.N. (retd.), M.B.O.U.

#### *Vice-Chairman:*

Captain Sir Thomas Barlow, Bt., D.S.C., R.N. (retd.)

Captain E. F. Aikman, R.D., R.N.R., representing Merchant Navy

#### *Hon. Secretary and Treasurer:*

Lieut.-Commander E. S. W. Maclure, R.N. (retd.), M.B.O.U.

#### *Assistant Editorial and Secretarial Staff:*

Captain N. B. J. Stapleton, R.D.

Meteorological Bird Reports

J. H. Agnew, Esq.

Ocean Weather Ships—Sea-  
birds Analysis

Commander M. B. Casement, R.N., M.B.O.U. Landbirds at Sea—  
Analyses: (a) Ocean Weather Ships records, (b) Sea Passage  
Reports, (c) Landbirds examined in the hand

Captain E. F. Aikman, R.D., R.N.R. (a) For all replenishments of  
Sea Report passage forms, (b) Assistant to Hon. Secretary

The following Ornithologists kindly assist in an advisory capacity:  
Dr J. G. Harrison, Dr B. B. Roberts, Professor V. C. Wynne-  
Edwards, C.B.E., D. J. Watkins-Pitchford, Esq., R. M. Lockley, Esq.

### *Addresses for Correspondence:*

Chairman—8 Little London, Chichester, Sussex, PO19 1PH

Hon. Secretary and Treasurer (and for details of membership)—

“Melrose”, 23 St. David’s Road, Southsea, Hants. PO5 1QH

Captain E. F. Aikman, R.D., R.N.R., “St. Cyrus West”, 48 Hep-  
burn Gardens, St. Andrews, Fife, Scotland, KY16 9DF

Commander M. B. Casement, R.N., H.M.S. *Mohawk*, c/o. B.F.P.O.  
Ships. (Home address: Dene Cottage, West Harting, Petersfield,  
Hants.)

Captain N. B. J. Stapleton, R.D.—38 Wilbury Crescent, Hove,  
Sussex, BN3 6FI

J. H. Agnew, Esq.—210 Main Road, Broomfield, Chelmsford,  
Essex, CM1 5AJ

## FOREWORD

### "THIRTY YEARS ON"

1976 sees R.N.B.W.S. thirty years old and still going strong thanks to all past and present members. During the time that R.N.B.W.S. has been in existence interest in the environment and bird life has spread immeasurably throughout all walks of life. This is also true of the interest being shown in birds at sea. The opportunities for bird watching among seagoers, be they experts or casual enthusiasts, are enormous in the greatest environment of all, namely the oceans of the world.

For those interested in bird life at sea, R.N.B.W.S. is an organisation both for the beginner and the expert. I feel it is not widely enough known among the seagoing fraternity, who can acquire much enjoyment and knowledge through membership. Perhaps we have been too modest in the past in publishing our achievements and spreading our knowledge. In any event efforts are now being made to publicise the Society a little more. Let us hope that more will enjoy membership.

It is fitting that this year a new book *A Field Guide to the Seabirds of the World* is to be published. It has been compiled by our indefatigable and indomitable Chairman, Captain Tuck; so it will certainly be authoritative and accurate. The R.N.B.W.S. is proud to be associated through our Chairman with this work. It will form a useful successor to that excellent book *Birds of the Ocean* by W. B. Alexander. It is hoped that all libraries in H.M. Ships will carry a copy of the new Field Guide.

I would like to conclude this foreword by thanking all those, including two naval funds, who have helped the Society financially in the past year by giving donations. This has been of great value in difficult times.

Let us hope that the next thirty years will see the Society going from strength to even greater strength through the enthusiasm of its members to whom we send all good wishes.

NIGEL HENDERSON, *President.*

## EDITORIAL

Since the publication of Vol. 25 - 1974/75, effort has been given to overcome the steadily decreasing balance in the Society's current account without, we hope, inflicting an undue increase in our members' annual subscriptions.

At the time of going to press with *Sea Swallow* Vol. 26 the financial position to 30th November 1976 is not yet available, but we cannot express adequately our deep gratitude to the response we have received to help us overcome the ogre of inflation.

The following donations have been received: From the Fleet Amenities Fund, £50. From the R.N. and R.M. Sports Control Board, £50.

### UNSOLICITED DONATIONS TO R.N.B.W.S. BY MEMBERS

This has been truly wonderful and acknowledged personally. Since many wished to be anonymous, we have received to date an additional sum of £195 making a total of £295.

NEW MEMBERS. 23 new members have joined in 1976.

### REPORTS FROM MEMBERS AT SEA

Sea passage report forms and census sheet passage report forms of seabirds have amounted to 82 passages, while landbird reports at sea have covered 28 passages. The latter have included some more unusual visitors on board such as a Great Blue Heron and a Greater Flamingo. 17 cases of seabirds examined in the hand and 27 cases of landbirds examined similarly have been received other than Ocean Weather Ship reports whose regular, valuable reports are much appreciated.

I wish to express my thanks also for the information we have received on bird observations contained in the Meteorological Log returns from many ships, details of which are forwarded to R.N.B.W.S. by Mr J. D. Brown monthly: I need hardly say that R.N.B.W.S. would welcome all concerned to full membership of R.N.B.W.S., and the source for obtaining membership can be obtained from our Hon. Secretary, Lt.-Cdr. Maclure, Royal Navy, at "Melrose", 23 St. David's Road, Southsea, Hampshire, PO5 1QH.

Finally, all these sea passage reports frequently contain very many serial numbers of observations of seabirds. The ocean maps on which all positively identified differing species of seabirds are plotted are now so overloaded with previous similar reports that on the more regular shipping routes, and indeed on a number of less frequented routes the occurrence of different species at differing seasons can be assessed with considerable certainty. This has been due entirely to the continuing interest and work of our R.N.B.W.S. members at sea. Long may it continue.

R.N.B.W.S. sends its greetings and good wishes to all its members.

G. S. TUCK, *Editor.*

## WHALE-BIRDS

By Commander J. R. Furse, F.R.G.S., R.N., R.N.B.W.S.

(Note by Editor: Cdr. Furse acted as principal Ornithologist during the earlier Joint Services Expedition to Elephant I., 1970/71. He is acting as Leader of a further Expedition during 1976/77.)

The old deepwater sailors knew well these little wild-flying Petrels of the southern oceans. The big clippers plying around the two great Capes of Good Hope and the Horn were escorted throughout the circumpolar westerlies by the grey erratic wraiths. The skippers and crews of little brigs and schooners out from Tonsberg, Dundee and Nantucket welcomed the whirling swarms of grey and silver birds, because they so often heralded the great whales they hunted in those cold waters. The grey birds became known to all seamen as Whale-birds or sometimes Ice-birds, as they were most numerous far south.

The link between the Whale-birds and the whales themselves was not chance. Both fed on the same bouillabaisse of crustacea and other zooplankton so plentiful in upwelling waters around the Antarctic continent. The Prions were often called Scoopers because of their habit of feeding with wings outspread and their heads underwater scooping up plankton and sieving the water out through their beaks which act like the baleen plates of the whales. The pelagic whaling fleets of Norway, Britain and the U.S.A. have hunted the whales nearly to extinction, destroying their own livelihood. (Only Japan and the U.S.S.R. still send whaling expeditions south.) So today there are few whales harvesting those cold oceans, but the Whale-birds still plane and whirl and swarm there. Their uncounted numbers have perhaps even increased as their incongruous competitors have been killed off.

Nowadays, fewer men see the Whale-birds in their pelagic ranges than did so in the last century. This is partly because of the reduction of whaling, partly because of the opening of the Panama and Suez Canals and partly because of the invention of aeroplanes. It is chiefly because these small blue-grey Petrels blend with the steely waves, to become almost invisible from closed bridges far above, so snugly windowed against the bitter outside. On the other hand we do know much more about their breeding biology and taxonomy than did the old deepwater sailing men.

We know that the popular title "Whale-birds" embraces several species of Petrels of very similar appearance and habits. One of these species, the Blue Petrel, *halobaena caerulea*, is alone in a genus completely different from the remainder, which are the various closely related Prions comprising the genus *pachyptila*. The complex taxonomy of the Prions has been confused by a

plethora of names; Murphy (1936), Falla (1940) and Fleming (1941) have reduced this confusion to the manageable six species listed below, which are those used by most authors:

- pv. Broad-billed Prion, *p. vittata*
- ps. Salvin's Prion, *p. salvini* ("Medium-billed Prion")
- pt. Fairy Prion, *p. turtur*
- pc. Fulmar Prion, *p. crassirestris* ("Thick-billed Prion")  
(southern race of *p. turtur*)
- pb. Thin-billed Prion, *p. belcheri*
- pd. Antarctic or Dove Prion, *p. desolata* ("Dove Prion").

At sea these divisions are academic, because the various Prions cannot be distinguished in flight. Attempts to identify species in flight have actually magnified the taxonomic confusion; sightings should be recorded generically as "*Pachyptila* spp" . . . On the other hand, if a Prion comes onboard, seize the opportunity to photograph it and to measure the wing and bill, particularly the diagnostic culmen length and width indicated in Fig. 1.

Fig. 1 shows the differences between the Whale-birds which are in the markings and shapes of the head, neck and tail. The Blue Petrel is quite distinct, but first one must know what to look for on the grey birds, which often fly together in mixed parties. They are also difficult to follow as they twist and intermingle erratically, and are blotted from view for much of the time as the mountainous swell of the roaring forties intervenes. The oft-quoted

square white tip to the Blue Petrel's tail is sometimes, but not always, noticeable; the black on the Prion's wedge-shaped tail shows both below and above, but again is not always noticeable.

I find the stylish flight, tapered wristy wings, high foreheads and general bill shape and size of all the Whale-birds very reminiscent of the true Plovers, although they are bigger birds (the wingspan of a Prion on Elephant Island was 25 inches). This resemblance extends to the markings of the head and breast, which I find the easiest diagnostic difference between the Blue Petrel and the Prions. In the field *halobaena*'s dark collar appears to encircle its throat (like a Ringed Plover, *charadrius hiaticula*) whilst the dark-grey smudge behind the Prion's eye is often indistinct (like a Kentish Plover, *c. alexandrinus*).

Fig. 2 shows the known breeding stations in the southern oceans. All the Whale-birds nest in burrows or labyrinthine crannies in scree, and all visit the breeding grounds nocturnally. At Elephant Island we saw them flying only between 0200 and 0500. This has prevented casual observations, so that there are still considerable doubts about breeding distributions. Until recently Blue Petrels were thought to nest in the Falklands and so to share the vernacular name of Firebirds with the Diving Petrels and Thin-billed Prions which fly into camp-fires at night like moths to a candle. Blue Petrels do not nest there, but were probably known as Firebirds, as well as Whale-birds and Ice-birds to the whalers with blubber stoves and trypot fires in South Georgia, long before the scientists quite recently rediscovered them breeding there.

Fig. 2 also indicates pelagic ranges, but these depend on scanty data from untravelled seas. The main pattern is a series of overlapping circumpolar belts forming a wide girdle which stretches north from the edge of the packice to the Sub-Tropical Convergence, near the Tropic of Capricorn. The Blue Petrel and the southern Prion species are probably all truly circumpolar away from the breeding grounds, whereas the more northerly Broad-billed and Salvin's Prions appear to remain in their own oceanic sectors throughout the year.

The Antarctic or Dove Prion is the only Whale-bird known to breed south of the Antarctic Convergence, apart from the Fulmar Prion at Heard Island. Its breeding biology is quite well known from studies in the South Orkneys (Ticknell 1962, Beck & Brown 1970). About 50,000 pairs breed there on Signy Island, yet just 400 kms. to the west on Elephant Island we found only two small colonies during the Joint Services Expedition in 1970/71. These were then the first proven records of breeding in the South Shetlands. The only known colonies further south than Elephant are the small ones shown at Scott Island and on the Antarctic Continent at Cape Denison. Antarctic Prions, like so many Petrels, nest underground and visit the nests at night to avoid the Skuas, which prefer their fat dove-sized bodies to the smaller Storm Petrels. The Prions tend to nest in colonies where there are interconnected galleries in consolidated scree or frost shattered outcrops, or in labyrinthine holes excavated in moss beds. They are typical townies, visiting the neighbours, fighting and kicking up a noise like a vast poultry farm through the hours of darkness.

The Thin-billed Prion feeds near the Antarctic Convergence. The other four Prion species are thought to feed north of the Convergence, except for the Fulmar Prion near Heard Island. The Broad-billed Prion is the most northerly and in its pelagic range off South America and South Africa is the Whale-bird most familiar to steamship seamen.

The Blue Petrel feeds far south to the edge of the pack and is fully circumpolar, but South Georgia is its only known breeding station south of the Antarctic Convergence and also the only one in the South American sector. At the end of March 1971, we first saw Blue Petrels as H.M.S. *Endurance* left Deception Island and passed northwest through the South Shetlands between Smith & Snow Islands. From there north to Diego Ramirez, Blue Petrels were common, whilst very few Prions indeed were seen. As we passed offshore in the evening, great numbers of Blue Petrels were headed toward Diego Ramirez; we believe that they must nest on these tussock islands half a day south of Cape Horn.

Could they perhaps nest further south in the South Shetlands? It is a question that is easier to pose than to disprove, but it is not a wholly irrational suggestion. The Whale-birds still hold their

mysteries. We shall be looking for them in the moraine and scree crannies of the Elephant Island Group on cold nights this January and February

## SOME NOTES ON BIRDWATCHING IN THE CARIBBEAN. 1975-6

By Lieutenant M. K. Barritt, R.N., R.N.B.W.S.

(Note by Editor: During 1975/76 Lt. Barritt was onboard H.M.S. *Beagle* surveying amongst Islands in the West Indies.)

Early contact with a local bird-watcher or Natural History group is essential to the R.N.B.W.S. member in these days of circumscribed ship visits. The individuals and organisations mentioned below showed much kindness to the compiler of this note in 1975-6, and would be delighted to see any other R.N.B.W.S. members.

### *Trinidad*

Ships in the Caribbean for extended periods may continue to use the facilities of Chaguaramas Shipyard. This is situated in excellent bird-watching country, and a short afternoon's walk without leaving the roads will reveal more species than are present in total in many of the smaller West Indian islands. Mr Ian Lambie, the Chief Customs Officer at Chaguaramas Shipyard in 1976, is a keen all-round naturalist, and is a willing guide to the attractions of the jungle hinterland, e.g. nesting hummingbirds, and the display-grounds of the White-bearded Mannakin (*Manacus manacus*).

The famous ornithological attractions of the island are the Scarlet Ibis (*Eudocimus ruber*) of Caroni Swamp, and the Oilbirds (*Steatornis caripensis*) at the Asa Wright Nature Reserve, Arima. Mr Winston Nanan (telephone: 638-3033) will hire out a boat for a visit to the Caroni Swamp, and will point out many of the other ornithological attractions of the area. The only Potoo (*Nyctibius griseus*) seen by the writer in his year in the West Indies was sighted in the swamp. Mr Lambie is on the Council of the Asa Wright Centre and is the best contact to arrange a visit. Overnight accommodation can be provided. Amongst many species which can be seen at the Centre are most of the indigenous hummingbirds, trogons, bell-birds, and manakins.

### *The Lesser Antilles*

Several very enthusiastic individual bird-watchers are active in the smaller islands.

Mr Michael Harvey of Cable and Wireless was based in Grenada in 1976. In Antigua, at the other end of the island chain, Mr Harvey has co-operated with Mr Carroll Holland of R.C.A. (telephone: 30153) to produce a list of 120 species for the island. Migrant shore-birds and waterbirds and warblers are of most interest. Each of the islands, however, has indigenous species of note, e.g. in Antigua the Blue-hooded Euphonia (*Euphonia musica*).

### *Jamaica*

The other large Commonwealth island of the region has a Natural History Society with which members should be able to make contact in the main towns. Most ships making a 'rest and recreation' visit will call at Montego Bay. Here the remarkable Rocklands Feeding Station at Anchovy (telephone: 952-2009) should be visited. This has become a tourist attraction since Miss Lisa Salmon has 'tamed hummingbirds' which will feed from bottles of sugar water held by visitors. With her most generous assistance genuine bird-watchers can sight many beautiful Jamaican birds which they might otherwise miss, e.g. the Jamaican Becard (*Platypsaris niger*), and the Jamaican Tody (*Todus todus*).

### *Extra-limital ports of call*

R.N.B.W.S. members transiting the *Panama Canal* and stopping for any length of time in the Canal Zone should try to visit the Smithsonian Tropical Research Institute on Barro Colorado Island in the Canal (telephone: 52-5669). Contact in 1975 was most kindly arranged by Her Majesty's Ambassador to Panama. In 1975 there were two Britons, Dr Michael Robinson and Dr Nicholas Smythe, on the staff of the Institute. Although their personal fields of work lay outside the ornithological field, they were willing guides to the best areas in which to see toucans, aracaris, trogons, motmots, mannikins, and many other jungle species.

A favourite 'rest and recreation' port in the U.S.A. is *St. Petersburg* in Florida. Tampa Bay, on which the city stands, is a fine seabird area. The most striking of the many species to be seen on the beaches is the beautiful Black Skimmer (*Rynchops nigra*). The Bay is the setting for a classic environmental clash between the seabird population and recreational fishermen. This has resulted in the founding by Ralph Heath Junior of the Suncoast Seabird Sanctuary, which is an inspiring example of active conservation and bird-care. The 'sickbay' and general bird-care work are of great interest to R.N.B.W.S. members. The telephone number of the Sanctuary is (813) 391-6211. Further information on the Sanctuary is held by the writer of this note.

### *Recommended Field Guides*

Birds of the West Indies, Bond J. (Collins)

Guide to the Birds of Trinidad and Tobago, Ffrench R. (Livingston)

Guide to the Birds of South America, de Schaunsee M. (Oliver and Boyd)

Guide to the Field Identification of the Birds of North America, Robbins, Bruun, Zim, and Singer (Golden Press).

A VISIT TO GOUGH ISLAND, TRISTAN DA CUNHA  
AND ST. HELENA,  
NOVEMBER to DECEMBER, 1974

By Radio Officer W. F. Curtis, R.N.B.W.S.

During a passage from Capetown to Gibraltar in R.F.A. *Reliant*, Curtis visited the islands quoted above and recorded the great variety and large number of oceanic species within the general areas.

Approaching Gough Island from approximate position 37°S, 01°E he observed Wandering Albatrosses, *Diomedea exulans*, Black-browed Albatrosses, *Diomedea melanophris*, Shy Albatrosses, *Diomedea cauta*, Sooty Albatrosses, *Phoebastria fusca*, Yellow-nosed Albatrosses, *Diomedea chlororhyncos*, Northern Giant Petrels, *Macronectes halli*, White-chinned Petrels, *Procellaria aequinoctialis*, Pintado Petrels, *Daption capensis*, Great-winged Petrels, *Pterodroma macroptera*, Brown Petrels, *Procellaria cinereus*, Soft-plumaged Petrels, *Pterodroma mollis*, Sooty Shearwaters, *Puffinus griseus*, Great Shearwaters, *Puffinus gravis*, Little Shearwaters, *Puffinus assimilis*, Schlegel's Petrels, *Pterodroma incerta*, Broad-billed Prions, *Pachyptila vittata*, Wilson's Storm-petrels, *Oceanites oceanicus*, Grey-backed Storm-petrels, *Garrodiu nereis*, White-bellied Storm-petrels, *Fregetta grallaria*, Common Diving-petrel, *Pelecanoides urinatrix*, Pomarine Skuas, *Stercorarius pomarinus*, Southern Great Skuas, *Catheracta skua*, Wreathed Terns, *Sterna vittata* and Common Noddies, *Anous stolidus*.

On arriving at Gough Island on 12th November the ship anchored 1 mile off Transvaal Bay and a visit was made to the Met. Station. Within some 300 yds. of the station about 150 pairs of Yellow-nosed Albatrosses were nesting. Along the cliff-top several pairs of Sooty Albatrosses were sitting on eggs. Some Wandering Albatrosses were reported to be breeding on higher ground while 200 Rockhopper Penguins, *Eudyptes crestatus*, were seen in a cave, and a few Common Noddies on the wing. Great Skuas were common and the numerous corpses of Broad-billed Prions clearly gave evidence of the mighty toll caused by the Skuas. Gough I. Buntings were numerous around the buildings.

On 13th November the ship reached Tristan da Cunha where the concentration of species was very similar. During the passage to St. Helena, Great and Cory's Shearwaters were seen, and at

anchor at St. Helena Red-billed Tropic-birds, Blue-faced Boobies, Pomarine and Long-tailed Skuas, White Terns and many Common Noddies. Further north on 1st December at 20°N, 13°W about 1,200 Grey Phalaropes were observed amongst other wintering species.

## OCEAN WEATHER SHIP REPORTS 1975/76

### SEABIRDS

Ocean Weather Station Lima lies 200 miles to the west of Rockall, 400 miles south of Iceland. The position – 57°N, 20°W – is between Stations India and Juliet.

Stations India and Juliet are no longer manned – at any rate by British observers. However, Station Lima was occupied by either Weather Surveyor or Weather Reporter for the full 12 months since last October. And in line with past practice an observer on each ship has sent in detailed bird counts for each day “on station”.

We have to thank Messrs A. Allwright, R. C. Aran, D. E. C. Hampton, R. Hayward, D. Ogle and S. J. Whitelock for their efforts in maintaining this continuous record.

It is the first time that a whole year has thus been covered without a break, and the results are summarised in the table below. As explained in *Sea Swallow* Vol. 25 (p. 15) it was decided to discontinue the detailed table “A” of previous issues. However, with the figures of an uninterrupted year of observations it was felt that a useful indication could be given of concentrations and sightings over the full period – hence the table.

An observer usually makes his “count” at a regular time and over a limited period each day – it has to be fitted in with his ship-board duties. As feeding and migrating species move through the area a different picture is available to the observer at different periods during the hours of daylight. This was vividly illustrated in the past year when, on two occasions, Weather Reporter had two independent observers taking counts at different times during the day. Broadly speaking the same species were recorded, but in widely differing concentrations. For the sake of continuity the figures of one observer only have been included in the table, though of course all records remain on file for future reference.

The few reports received from Station Lima before this (July, August and part of September 1975) reinforce the figures given for those months in the table.

Sadly, there were fewer “off-beat” notes made during the year. R. Hayward (16th October 1976) reported 50 Pilot Whales – which coincided with the sighting of 5 Arctic Terns on the same day. A Storm-Petrel boarded Weather Surveyor on July 28th, and

was caught "flying up and down the alleyways and released by one of the crew". On 3rd February 2 Black-backed Gulls were reported (S. J. Whitelock) one of which had evidence of red dye on its body under the wing.

And it is worth mentioning that of the 29,279 Fulmar Petrels seen during the year, only 14 individuals were noted to be "blue phase".

## OCEAN WEATHER SHIP OBSERVATIONS

SUMMARY OF SIGHTINGS, STATION LIMA (57°N, 20°W)  
OCTOBER 1975 to OCTOBER 1976

## LANDBIRD SUMMARY

By Commander M. B. Casement, R.N.

The overall size of the analysis this year is somewhat smaller because, primarily for reasons of economy, I have been more selective to show only those of greatest interest, whose identity

is reasonably certain, and are of greatest relevance to migration. As will be seen from the tables, the pattern is very similar to previous years and includes a high number of observations gleaned from the Meteorological Logs of Merchant ships for which I must thank once again Mr J. D. W. Brown of the Meteorological Office. Sadly, the volume of records from the Ocean Weather Ships has decreased now that only Station Lima is regularly manned.

Once again Lt. P. J. C. Morgan, R.N., of H.M.S. *Ark Royal* has submitted detailed records of autumn migration in the North Sea (Table D) which fits in well with the reports from east coast observatories. In October these were submerged by a huge drift of Scandinavian migrants from as far afield as Siberia. There was in particular a spectacular invasion of Goldcrests (*Regulus regulus*); for example at Dungeness 731 were ringed during October which is twice the previous annual total (see B.T.O. News, Dec. 1975).

Again as in previous years there is a high number of Owl records identified as Short-eared Owl (*Asio flammeus*), but since in Britain 1975-6 was remarkable for an invasion of Long-eared Owl (*Asio otus*), I wonder whether some of these may have been the latter species. The close similarity of the two in flight is explained in detail in an article in *British Birds* (August 1976 - Vol. 69, No. 8, pp. 1281-87) and it is suggested that these Owls are frequently misidentified. In particular it says of the short-eared in flight "... ear tufts are not usually visible and never prominent". I ask therefore that R.N.B.W.S. members pay special attention and record more detailed descriptions of all such Owl records in future.

Ships on passage clearly play an important and regular part in assisting weakened migrants to cover long distances, and over the years there have been regular R.N.B.W.S. reports of such examples, as the Cattle Egret (*Bubulcus ibis*) which hitched a transatlantic lift (Table C, Ref. H). However, not always is this to the birds' advantage, as for example, the Sandmartins (*Riparia riparia*) 200nm off W. Africa (Table B) carried 530nm in the wrong direction.

The other point which stands out from analysis is that there is scarcely a month in the year when landbirds are not recorded at sea; apart from the obvious main peaks in spring and autumn, the migration season is much longer than is generally realised.

Now that the Suez Canal has reopened I am hoping for more records from the Gulf of Aden. My radar observations (1962-3) showed that there is a high concentration of migration in this area (mostly unseen at night) in a density higher than anywhere I recorded in the Mediterranean. Careful watch by ships passing through this area could be specially rewarding.

Good luck to you all in 1977.

# OCEAN WEATHER SHIPS - STATION REPORTS OF LANDBIRDS

Analysis by Commander M. B. Casement, R.N.

The following reports have been received during the period 1975-6 (up to 1 October 1976).

STATION LIMA (Position 57°00'N 20°00'W) 210nm WSW Rockall, 450nm S. Iceland. Details are shown in the table below for all observations recorded on station. Records made on passage are included in Table A of the passage report analysis.

1975

19 Aug-7 Sept	Weather Surveyor	1	S. J. Whitelock
14 Sept-8 Oct	Weather Reporter	1	D. Ogle
13-31 Oct	Weather Surveyor	2	M. Allwright
1-23 Nov	Weather Reporter	1	D. Ogle
24 Nov-18 Dec	Weather Surveyor	No landbirds seen	S. J. Whitelock

1976

29 Feb-26 Mar	Weather Surveyor	No landbirds	R. C. Aran
26 Mar-12 Apr	Weather Reporter	No landbirds	D. Ogle
22 Apr-2 May	Weather Surveyor	1	S. J. Whitelock
11 May-3 June	Weather Surveyor	1	2/0 R. Hayward, D. Ogle
24 July-12 Aug	Weather Surveyor	1	D. E. C. Hampton
15 Aug-7 Sept	Weather Reporter	1	D. Ogle

## BIRDS EXAMINED IN THE HAND

Six reports were received during the period from M. Allwright (3), S. J. Whitelock (2), and D. Ogle (1). Details are given in the table as shown by notation X. BM = corpse sent to British Museum, Tring.

## ANALYSIS BY SEA AREAS

This analysis includes records from the following sources:

- a) R.N.B.W.S. Sea Report Sheets (Landbirds) - indicated by reference letters
- b) Meteorological Log Returns (identifiable species only) - indicated by MET
- c) OWS reports on passage - indicated by OWS and name of ship

Observations are analysed in the following tables by sea areas:

Table A	East and North Atlantic (East of 30°W including Biscay, Iberlant, and North of 51°N)
B	East Atlantic (West Africa) - Gibraltar to Cape of Good Hope
C	West Atlantic (West of 30°W) and Caribbean
D	North Sea, Barents Sea and English Channel
E	Mediterranean
F	Indian Ocean, Red Sea and Persian Gulf
G	Pacific and China Sea

Note: The reference letter in column 2 of each table refers back to the passage details shown in the table above (Column 4)

## BIRDS EXAMINED IN THE HAND

Twelve reports were received during the period from: Lt. P. J. C. Morgan (3), J. M. Welch (1), Capt. R. R. Will (4), and S. J. Hingston (4). Full details are given in the appropriate tables as shown by notation X in remarks column.

Notation BM - Corpse sent to British Museum, Tring.

## SOME EXTRACTS FROM METEOROLOGICAL REPORTS 1975/76

From notes received and selected by  
Captain N. B. J. Stapleton, R.D.

(*Note by Editor* It is a well-deserved tribute to those sharing our interest in birds at sea that the Meteorological Office now receives in Met. Log returns more reports about seabirds than all others put together, with the exception perhaps of marine life. We thank all concerned over the year. Due to the large input, all of which are taken note of, and to restriction in space, we publish in this section mainly those which throw either new or particular aspects on the habits of birds at sea.)

### ALBATROSS ONBOARD

Albatrosses are very rarely found onboard, and always appear gentle and easily handled. When Captain I. R. Ansell, S.S. *Benroech*, was on passage from U.K. to Durban on 28th June 1975 in position 26.55 South, 12.00 East, a young Albatross landed on deck. As the Second Engineer approached, it sat down and allowed him to lift it in his arms without any fuss, spread its wings and glided from the ship unharmed.

Its identity was not established but clearly one of the smaller species of Albatross commonly known as a "Mollymawk".

### PETRELS AND SHEARWATERS

When Captain J. Howarth, M.V. *Ulster Star*, was on passage from Suez to Melbourne in position 14.08 South, 86.10 East, in the Indian Ocean on 9th February 1976 large seabirds were seen fishing about 200 yards from the ship.

As quoted, these would have been Pale-footed Shearwaters, *Puffinus carneipes*, which breed off the south-west coast of Australia and after their breeding season migrate towards the Arabian Sea and are seen regularly in the eastern section of the Indian Ocean and later off the Arabian coast.

### STORM-PETREL ONBOARD

Captain J. Conn, M.V. *Dunstanburgh Castle*, in position 20.54 North, 17.03 West, on 7th June 1975, reported that an exhausted seabird crashed onboard with oil on its wings and head feathers in a ragged state. The Electrician took charge and made it comfortable in his cabin. After 36 hours it began to recover and flutter about the cabin. When the ship was passing through the Canary Islands later it had recovered and flew off into the wind with no difficulty. From the description and measurements the bird was probably a Madeiran Storm-petrel, *Oceanodroma castro*.

*Thirty-eight*

## GULLS

(Note by Editor Gulls did not figure prominently in these reports, but one more unusual occurrence is recorded.)

Captain D. Newlin, M.V. *Columbia Star*, on passage from Christobal to Le Havre on 17th February 1975, was visited by six Gulls in position 34.18 North, 40.12 West which all landed on a deckload of containers.

Two finally remained on deck. From their description, one was an adult Herring Gull, *Larus argentatus*, medium grey and white above with yellow bill; the other "speckled" with a black back and slightly larger, possibly an immature Great Black-backed Gull, *Larus marinus*. The ship was roughly equidistant from Bermuda, Sable Island, Cape Race and the Azores, well out in the North Atlantic. Both species occur off the east coast of U.S.A. Both species are also quite plentiful around Bermuda in winter, and further north the Great Black-backed Gull only has been known to follow ships at times on crossings between Britain and the U.S.A. but the occasions are rare well out at sea.

## TERNs

1. Captain I. G. Lumley, M.V. *City of Colombo*, on passage from Capetown to Halifax in position 14.5 North, 14.27 West, observed a group of Roseate Terns, *Sterna dougalli*, passing over his ship on an easterly course. These species migrate southwards to Africa in the autumn and have usually been reported close offshore or in harbours by ships.

2. Captain A. G. Cruickshank, M.V. *Clan Maclean*, on passage from Las Palmas to Capetown in position 7.00 North, 14.00 West also found a Roseate Tern exhausted and wet onboard on 6th September 1975. When picked up it was put in a tissue-lined shoebox and found warmth at the entrance to the engine room, recovered 5 hours later and flew off.

## TROPIC-BIRDS

(Note by Editor We receive more observations of Tropic-birds (Bosun Birds) than other species as they are occasionally found on deck after collision with the ship's structure, dazzled by the ship's lights at night. When seen in flight by day, however, it is not always easy to differentiate between species.)

1. Captain T. E. Roberts, M.V. *Clan Macindoe*, in position 30.26 South, 14.40 East, west of Cape Province on 15th December 1975 sighted a "Bosun bird" attempting to alight on the foredeck over a period of one hour but without success, the ship pitching moderately. The species was probably a White-tailed Tropic-bird, *Phaethon lepturus*. This is unusual so far south and is quoted in the *Field Guide to the Birds of Southern Africa* as a "rarer species". R.N.B.W.S. has no plot of it in this area previously. Its nearest breeding area is on Ascension Island.

2. Captain R. J. Sankey, M.V. *Cumbria*, in position 40.01 South, 141.28 West on 3rd February 1976 observed a Red-tailed Tropic-bird, *Phaethon rubricauda*, and gave a very positive description. This is interesting as the furthest south in the Pacific Ocean that this species has yet been plotted.

3. Captain F. Smith, M.V. *City of Auckland*, reported a Red-billed Tropic-bird, *Phaethon aethereus*, onboard in position 17.04 North, 18.26 West on 8th July 1975. It had obviously been injured, and although carefully attended, collapsed and died on 10th July. They breed on Cape Verde Islands.

## BOOBIES

Captain J. F. Houghton, M.V. *Vancouver Forest*, during a Pacific crossing from Balboa to Osaka had a Brown Booby, *Sula leucogaster*, onboard for a total of 1,300 miles, not the first time these Boobies have enjoyed a long voyage onboard.

## CORMORANTS

Captain P. Malarky, M.V. *Gazana*. While at anchor in Yokohama Bay on 21st May 1976, a Penguin was reported swimming around the ship. Penguins however are entirely confined to the Southern Oceans (except for the Galapagos Penguin). It could have been mistaken easily when swimming for a Japanese Cormorant, *Phalacrocorax capillatus*, which are common locally and have white filoplumes covering the head in breeding plumage, a black back and white marking on underbody as reported.

## LANDBIRDS

A few reports of the many, as examples (see last paragraph).

1. M.V. *California Star* (letter from ship and good sketch). The ship was in the Caribbean when the landbird came onboard. It has been identified as an American Purple Grallinuli, *Porphyrola martinica*. This is a species of Moorhen which occurs in America and the West Indies, normally living in swamps. It has occurred onboard ships close to land before and Captain Tuck remarks that as a young Naval Cadet 55 years ago in a Training Cruiser he had one onboard for several days before releasing it close to an island.

2. Other landbirds reported onboard in the Caribbean have been Cattle Egret, *Bubulcus ibis*, from Captain D. M. Mephail, M.V. *Avelona*: a Plumed Egret, *Egretta intermedia*, in the Straits of Malacca from Captain R. Moore, S.S. *Osaka Bay*; a long-eared Owl, *Asio otus*, in the Gulf of Cadiz from Captain A. S. Matheson, *City of Famagusta*: an Osprey, *Pandion haliaetus*, 37 miles off the coast of California from Captain D. Jack, M.V. *Fresno City*.

A comprehensive return of landbirds observed on sea passages including Meteorological returns, is included in Commander Case-ment's analysis of "Landbirds at Sea" in this volume.

## SHORT NOTES

### WANDERING ALBATROSSES, *Diomedea exulans*, AND ROYAL ALBATROSSES, *Diomedea epomophora*,

(see Figs. 1 and 2 on pages 42 and 43. Plumage patterns) -

It is not always easy to differentiate between the two at sea, but the following note may help:

Juvenile and immature Wandering Albatrosses have much more brown on their body plumages, including cases with brownish crowns and dark tips to the tails than any Royal Albatrosses. Royal Albatrosses at *all stages* have white heads, underbodies and tails, including the dark upperwing Northern race, *d.e. Sandfordii*, but the adult Southern race, *d.e. epomophora* looks very similar to adult male Wanderers, but at close range the dark cutting edges to the mandibles of Royals should be looked for.

### GREATER FLAMINGO, *Phoenicopterus ruber*, ONBOARD

This great bird landed on the deck of M.V. *Montague* off the Bahama Islands in position 21°54'N, 74°22'W on 10th January, 1976, Acklins I. being 3 miles away. Third Mate J. Booth, R.N.B.W.S., recovered it, measured it, sketched it and took a colour photo of it standing in his washroom. Later he gave it water and released it.

An important breeding colony exists on Great I., Naqua Is, and smaller colonies exist on Andros and Abaco Is. and possibly elsewhere in the Bahama Group. One of the tallest birds that has occurred onboard at sea.

### UNINVITED "SQUATTER"

On 29th September, 1976, Captain E. F. Aikman, R.D., was walking along the harbour at St. Andrews, Fife, and noticed a number of lobster creels outside a fisherman's shed awaiting repair. A workman saw a bird enter one of the creels and called Captain Aikman over. Settled comfortably inside was an adult Moorhen which appeared not in the least alarmed by close observation. Next day the bird was still "squatting" but made no objection to being removed and placed on the grass behind the sheds, whereupon it pattered off in the manner of Moorhens, apparently unharmed.

## BOOK REVIEW

*BIRDS OF THE MALTESE ARCHIPELAGO*. By DAVID A. BANNERMAN and JOSEPH A. VELLA-GAFFIERO. Colour illustrations by CHLOE TALBOT KELLY. 500 pages, 22 colour plates, (190 birds), over 200 line drawings.

Dr David Bannerman enjoys world-wide recognition as an Ornithologist and Author, covering many areas in the world of

BILLS: 1a-1d: Normal. Flesh-pink; nail horn. LEGS: Black-flesh; legs 1.5: Length.

The extreme Southern race *D. e. chionoptera*, sometimes known as the "Snowy" Albatross is somewhat larger. Birds of all age groups are entirely white except for the wing tips. Commonly seen in Australian seas when met at breeding stations. There is no black line along the cutting edges of the mandibles.

birds. This book is no exception, covering in detail the many species which cross the Mediterranean Sea on migration between Europe and Africa and are to be found in the Maltese Archipelago. Each species is described in detail together with its breeding range, its habits and habitats.

His Maltese partner, Joseph A. Gaffiero, has enjoyed a lifelong interest in the birds of the Maltese Islands, and has played a major part in the coverage of the Ornithology of the birds of the Maltese Islands.

Printed and published by the Museum Department, Republic Street, Valletta, Malta, G.C., at £M 3-75\* plus £M 0-25\* for postage and packing. (\* or £4.75 from U.K. booksellers.)
